Cogeneration and Small Power Production

Net Metering

Net metering is a policy in which a utility must purchase power generated by its customer at the same retail price it sells electricity to the customer. It is typically used as an incentive for customers who install renewable energy systems, such as wind turbines. Net metering was first considered as a result of the Public Utility Regulatory Policies Act of 1978. South Dakota's policymakers debated it and chose not to implement net metering at that time. The South Dakota Legislature has considered this issue a number of times and concluded mandatory net metering is not in the public interest. For details of those legislative processes see 2013 Legislative Session, [HB 1207](#); 2015 Legislative Session, [HB 1232](#); and 2016 Legislative Session, [HB 1216](#).

The reason net metering has not been adopted is the utility would be forced to pay the generator far above the market cost of generation. Further, the utility would not be able to schedule the generation of the electricity and it would be worth even less than the electricity they are already buying for a lower price.

Retail electricity rates are based on the cost of generation as well as the cost of distribution and transmission facilities. Thus, if utilities must pay above market rates for substandard power, rates will eventually have to go up to cover their increased expenses. The increased rates will have the largest effect on low income customers, who would not be able to afford the upfront costs of renewable energy systems in the first place.

Small generators do have an opportunity to sell power to their utility without net metering. The purchase price the utility pays must reflect the value of the generation and is regulated by the Federal Energy Regulatory Commission. It does not include the costs of transmission, distribution, overhead and other costs of providing electrical service that are included in net-metered rates. All electric utilities regulated by the PUC are obligated to interconnect with and purchase power from small wind facilities if the generator desires and agrees to the terms.

Rates paid to small generators by investor-owned electric utilities must be filed with the PUC. This transparency allows the producer to easily review and compare rates to make an informed decision regarding the economics of a small renewable power facility.

Bergey Excel in Juniata, NE

The 15 kW wind turbines utilize a 100' tower and the rotor diameter is 31.5. The highest point of the blade tip is 116'. Wind turbines benefit greatly by placed higher, allowing them to take advantage the higher winds aloft but more importantly avoiding turbulence created by nearby structures and even the ground itself. By avoiding this turbulence the turbines last longer and more safely due to reducing the aerodynamic stresses on the turbine and tower.

To Whom it May Concern,

This statement will certify that all components of the Bergey Windpower Excel 15 wind turbine have been designed in conformance with AWEA 9.1-2009, AWEA Small Wind Turbine Performance and Safety Standard. Towers sold by Bergey Windpower for use with the Excel 15 turbine meet the requirements of ANSI/TIA 222-H, as referenced in the International Building Code IBC 2018. The Rohn Self-Supporting Lattice tower has been used successfully in hundreds of sites over the last four decades with an earlier BWC turbine model which produces similar tower loads. With proper installation and maintenance, the risk of tower failure is extremely minimal.

Sincerely,

Kenneth Craig PhD, PE

Tower Input Data

The main tower is a 3x free standing tower with an overall height of 94.70 ft above the ground line.

The base of the tower is set at an elevation of 0.00 ft above the ground line.

The face width of the tower is 1.00 ft at the top and 14.00 ft at the base.

This tower is designed using the TIA-222-G standard.

The following design criteria apply:

Basic wind speed of 120.00 mph.

Structure Class II.

Exposure Category C.

Topographic Category 1.

Crest Height 0.00 ft.

Nominal ice thickness of 0.75 in.

Ice thickness is considered to increase with height.

Ice density of 56 pcf.

A wind speed of 50.00 mph is used in combination with ice.

Temperature drop of 90 °F.

Deflections calculated using a wind speed of 60.00 mph.

Weld together tower sections have flange connections..

Connections use galvanized A325 bolts, nuts and locking devices. Installation per TIA/EIA-222 and AISC Specifications..

Tower members are "hot dipped" galvanized in accordance with ASTM A123 and ASTM A153 Standards..

Welds are fabricated with ER-70S-6 electrodes..

A non-linear (P-delta) analysis was used.

Pressures are calculated at each section.

Stress ratio used in tower member design is 1.

Local bending stresses due to climbing loads, feed line supports, and appurtenance mounts are not considered.
